ABSTRACT

This publication presents the results obtained from the most recent Survey of Nonpublic Elementary and Secondary Education (1970-71). The data included present a measurement of the scope, describe some of the characteristics, and reflect the status of the nonpublic schools in 43 large cities in the United States. Nonpublic schools are defined as schools that are privately controlled by a nonpublic entity and that are financed from sources other than public taxation or public grants. Included are parochial schools; privately operated schools providing education equivalent to that of the public elementary and secondary schools for students who are deaf, blind, mentally retarded, or who have other types of physical or mental exceptionality; private college preparatory schools or military academies; "finishing" schools; and practice or laboratory schools of private colleges and universities. The survey instrument is presented in the appendix. (Author/DN)

FOREWORD

The National Center for Educational Statistics, Office of Education, recently issued the results of the 1970-71 Survey of Nonpublic Elementary and Secondary Education under the title Statistics of Nonpublic Elementary and Secondary Schools, 1970-71. The present report is supplementary to that report and is intended to present similar statistics for 43 large cities of the United States. It is hoped that the data provided will prove useful to individuals and groups interested in information about nonpublic schools for particular cities and to those studying general characteristics of large-city nonpublic schools. These data should prove useful also to those with a comprehensive interest in elementary and secondary education in large cities by making available a more complete profile than is attainable by analyzing public school districts in isolation.

The 1970-71 survey from which the data in this report were drawn was made possible through cooperation of State education agencies, the National Catholic Educational Association, other organizations serving nonpublic schools, and the individual responding schools. The Office of Education wishes to thank those involved for assistance in collecting the data.

Roy C. Nehrt, Chief Elementary-Secondary Surveys Branch Dorothy M. Gilford Assistant Commissioner for Educational Statistics

Linda A. Barker, formerly of the National Center for Educational Statistics, contributed to development of the tabular materials.

INTRODUCTION

There is evidence of wide current interest concerning the schools and school systems within large cities of the United States. This report seeks to broaden the available data base on large-city elementary and secondary education by presenting a description of nonpublic school participation. Public school systems in many large cities, beset with numerous difficulties, are requesting increasing financial and technical support from sources beyond the local level. Many nonpublic schools, citing their contribution to public functions, are also actively seeking assistance from public agencies. In view of these concerns, the question ultimately arises as to how much of the burden of education in large cities is actually being borne by other-than-public schools.

This report, based on city data from a 1970-71 survey of all nonpublic elementary and secondary schools, provides material for answering such a question. About 17,000 nonpublic schools were operating within the United States (excluding outlying areas) in the fall of the 1970-71 school year. Of these, 27 percent (4,628) were located within the city limits of the 50 largest cities of the Nation. Because the response rate in the 1970-71 survey from Honolulu, HI, (41st in size, with a population of 325,000, according to the 1970 Census of population) was known to be unacceptable, that city was omitted from the original tabulations of large-city data, and Wichita, KS, (ranked 51st, with 277,000 population) was substituted. A review of the resulting tables caused the removal of an additional seven cities from this presentation, because they too had an un-

BEST COPY AVAILABLE

acceptable response rate (less than 75 percent of their response to the survey questionnaire). The data in this report, therefore, focus on nonpublic schools in 43 of the largest cities. The combined response of these cities represented 89 percent of all their nonpublic schools; their proportion of the enrollment in nonpublic schools is unknown, and data, except names and addresses, are available of the missing institutions.

This is the first report of city data resulting from an Office of Education universe survey of nonpublic schools. The data herein are based solely on reports from schools responding to the 1970-71 survey of nonpublic elementary and secondary education, which was designed to produce data by State. Although no attempt has been made to estimate for nonresponse, these statistics are considered the most comprehensive thus far published and should make it possible not only to analyze nonpublic schools in their own right but also to study the overall educational complex of the particular large cities. It is hoped the report will prove useful to researchers measuring the impact of nonpublic schools on the educational establishments of those cities.

¹ The response to the 1970-71 survey of nonpublic elementary and secondary education fell below 75 percent of the known nonpublic schools in each of the seven mainland cities omitted from this brochure. The cities are: Burmingham, AL (65.7%); Los Angeles, CA (68.2%); Miami, FL (54.8%); Hashville-Davidson County, TN (73.3%); Newark, NJ (63.9%); Norfolk, VA (74.1%); and St. Louis, MO (67.8%).

SOURCE AND LIMITATIONS OF THE DATA

BEST COPY AVAILABLE

The 1970-71 national survey was conducted on a universe basis, and its comprehensive statistical results are analyzed by State in Statistics of Nonpublic Elementary and Secondary Schools, 1970-71. About 95 percent of the Catholic schools responded. The non-Catholic school response of 78 percent was inflated to 100 percent by means of a special nonresponse sample survey. In the tabulation herein presented by city, only responding schools are represented, since at the time of the survey no controls for city location were incorporated into the methods used to estimate for nonresponding schools. Prior to application of inflation procedures to the non-Catholic school data, the overall response rate to the 1970-71 survey was 89.1 percent. The response rate among schools in the cities covered in this report, if we included respondent schools from the sampling effort, averaged 89.0 percent of all nonpublic schools, representing 3,615 of the 4,060 schools functioning in the 43 large cities listed. Particular response rates for individual cities ranged from a low of 77.8 percent for Washington, D.C. to 100.0 percent each for Oklahoma City, OK, and Toledo, OH.

Response rates for each city are detailed in table 20. Whenever national and large-city data are compared in this report, it should be remembered that the former figures are partially estimated and the latter represent only responding schools.

Unsatisfactory and inadequate responses to the survey were due to a number of factors chiefly related to the characteristics of nonpublic schools. Except for Roman Catholic schools, which are being encouraged to provide annual data for the National Catholic Educational Association, most nonpublic schools do not report regularly or consistently to any central authority or organization. Many maintain scant records and are unfamiliar with reporting strictures. A number of them consider certain data about their operations, such as financial records and racial data, privileged and proprietary. All these factors affect response in surveys of nonpublic schools.

Tabulation of nonpublic school data by city utilized ZIP codes to identify schools located within the limits of the specified cities. ZIP codes and city boundaries are

coterminous in all but three of the largest cities included—Baltimore, Chicago, and Washington, D.C. Where ZIP codes crossed city lines, schools having that ZIP code in their address were researched to determine their exact physical location. Schools ascertained to be located physically outside the city limits were then excluded from the tabulation.

Unlike most public schools, nonpublic schools frequently draw their membership from outside their immediate neighborhoods. While the schools included in this study have been determined to be physically located within the city limits, no statement can be made concerning the number of their enrollees who are residents of that same city.

In table 21, the 43 selected large cities included in this presentation are ranked by size of population, nationally and within their own number, and by reported size of enrollment in nonpublic schools. The 43-city totals for the cities under discussion may be summarized as follows:

Item	Total	Roman Catholic	All others
Schools:			
Total	3,615	2,794	821
Elementary	2,791	2,235	556
Secondary	644	559	85

USE OF THE REPORT - PROFILE OF A CITY

BEST COPY AVAILABLE

The tables in this publication reveal that characteristics of nonpublic schools vary widely from city to city. Thus, these data should prove most useful as a reference guide in analyzing nonpublic schools for particular cities.

To illustrate the types of data in this report, a profile for nonpublic schools in the city of Cincinnati, OH, is presented. The response rate for that city was 96.5 percent, with but four of the nonpublic schools located within the city limits unrepresented in the basic statistics. Fourteen percent of the nonpublic schools in State of Ohio³ were located in Cincinnati (table 13). Of the reporting schools in Cincinnati, 87 offered exclusively elementary-level instruction, 22 offered exclusively secondary-level instruction, and only 2 schools combined both the elementary and secondary grades under a single administration (table 1).⁴ Nonpublic schools within the city were predominantly Roman Catholic; 98 of the 111 schools (88 percent) were under the auspices of the Roman Catholic church.

Seventeen percent of Ohio's nonpublic school pupils were attending schools located in Cincinnati (table 13). During the 1970-71 school year, there were 38,810 elementary pupils and 17,157 secondary pupils enrolled in the city's nonpublic schools (table 1). This placed Cincinnati seventh in reported nonpublic school enrollment size among the 43 large cities (table 21). The 1970 census indicated that Cincinnati ranked 29th in population size among large cities in the United States. Pupils enrolled in Roman Catholic schools represented 96 percent of the total nonpublic school enrollment reported for the city. About 9 percent of Cincinnati's nonpublic schools and 5 percent of the pupils enrolled in

such schools were located within the inner city (table 17).5

The reporting nonpublic schools in Cincinnati employed the equivalent of 1,345 elementary teachers and 806 secondary teachers in 1970-71 (table 1). The city-wide average elementary-level pupil-teacher ratio was thus 28.9 and the average secondary-level pupil-teacher ratio was 21.3. Catholic schools reported pupil-teacher ratios substantially higher than those for other-than-Catholic schools. At the elementary level, these ratios were 30.1 and 15.6 for Catholic and other-than-Catholic schools, respectively; at the secondary level, 22.6 and 8.8 were the respective ratios.

Nonpublic secondary schools in Cincinnati were predominantly comprehensive high schools, with over three-fifths of them offering three or more curriculums. These 15 comprehensive high schools accounted for about 83 percent of the city's reported nonpublic secondary school enrollment. (See tables 14 and 15.) Six of Cincinnati's high schools were exclusively college preparatory and three offered one curriculum in addition to college preparatory. No secondary schools were reported offering only a general course of studies. It might be noted parenthetically that, within the total of 805 nonpublic secondary schools in the 43 cities responding to the curriculum inquiry, only 13 high schools of this latter type were reported.

As shown in table 166, programs for the academically talented were found in 34 of Cincinnati's 111 responding nonpublic elementary and secondary schools; 76 percent of the city's nonpublic school pupils attended

³The survey response rate for nonpublic schools in Ohio was 96 percent.

⁴The survey instrument used for collecting data on Roman Catholic schools did not allow for reporting of combined elementary-secondary schools. Such schools were reported separately as elementary schools and as secondary schools, which reflects the usual pattern, except for schools operated by religious orders.

⁵The questionnaire definition of Inner-City Area reads: An area which is characterized by a large number of low-income inhabitants within a city or twin cities of 50,000 or more population (a major city). It may be a "model neighborhood," as designated by the Model Cities program of the Department of Housing and Urban Development, or have similar characteristics.

Although the response to this item was inadequate, the table is included as an exhibit because of considerable interest expressed in this area. See footnote to table 16.

BEST COPY AVAILABLE

schools offering such a program. Compensatory education programs were also offered by 34 nonpublic schools; 58 percent of the city's nonpublic school pupils had access to these programs by virtue of being enrolled in such schools. In addition to the above-named programs, vocational/technical programs (7 schools), programs for the handicapped (6 schools), and continuing education programs (2 schools) were available to a lesser degree in Cincinnati's nonpublic schools. English as a second language, a sixth program specified on the questionnaire, was not reported by any of the nonpublic schools in this midwestern city.

Examination of table 9 reveals a unique situation within the city of Cincinnati with respect to the grade spans of its nonpublic schools. While most of the other large cities reported prekindergarten to grade 8, kindergarten to grade 8, or grades 1 to 8 as the predominant grade spans, only 22 of the 87 non-public elementary schools in Cincinnati could be characterized in this way. The most common grade span in Cincinnati occurred under the heading of "other." Contained in this category were the Catholic elementary schools which were forced to discontinue the preprimary level and grade I several years ago for financial reasons; those schools consequently begin with grade 2. Secondary schools in Cincinnati tend to follow the craditional organizational pattern for nonpublic high schools-grade 9 to grade 12 (18 schools).

Thirteen of the 111 responding schools in Cincinnati reported enrollments of 1,000 or more pupils (tables 6, 7, and 8); 9 of these were secondary schools. The remaining secondary schools were evenly divided among the smaller-size group categories. At the elementary level, the largest single number of reporting schools (33) fell within the size range of 100 to 299 pupils.

Only one nonpublic school in Cincinnati reported having begun operations since the fall of 1965. Twenty-two schools had opened between 1945 and 1964, and 17 schools between 1925 and 1944. Of the 96 schools responding to this item, more than half (56) were founded prior to 1925, with 3 schools reported to be more than 120 years old. Only 10.4 percent had been founded since the Supreme Court's school desegregation decision in 1954. (See table 11.)

The tabulations presenting statistics on minoritygroup enrollment (tables 2, 3, and 18) show 55,384 pupils enrolled in Cincinnati schools responding to this question (99 percent of the total enrollment reported). These tabulations show that almost 5 percent of these 55,384 nonpublic school pupils were classified as belonging to one of four specified minority groups.7 At the elementary level, minority groups constituted almost 6 percent of the enrollment; at the secondary level, only 3 percent. Negroes represented the bulk of minority-group enrollment (2,540 out of 2,721) in the nonpublic schools of Cincinnati. While minority groups comprised but 5 percent of nonpublic school enrollment for the entire city of Cincinnati, they made up 38 percent of the total in such schools located in the inner-city areas.8 (See table 18.) Approximately 36 percent of all the minority-group pupils in Cincinnati were reported attending nonpublic schools located in inner-city areas areas which contained only 4.7 percent of the city's reported nonpublic school enrollment.

⁷American Indian, Negro, Oriental, and Spanish-surnamed American.

⁸See footnote 5, page 3.

VARIATION AMONG CITIES

BEST COPY AVAILABLE

The Cincinnati, OH, profile shows how the data in the tables can, with caution, be used descriptively for any of the listed cities. However, the great variations among the large cities make generalizations concerning their nonpublic schools and pupils not particularly meaningful. The tabulation below of 1970-71 figures for 18 of the 43 cities, for which relatively comparable public school data were collected in the 1970 and 1971 fall surveys of enrollment, points up gross differences in

nonpublic school participation in the education of elementary and secondary school pupils.

Based on enrollment data, the burden of elementary and secondary education assumed by nonpublic schools in the 18 cities ranged from under 10 percent each in Dallas, Houston, Memphis, Phoenix, and San Diego to more than 30 percent each in Cleveland and Philadelphia.

	Elementary	Elementary and secondary enrollment

SUMMARY OF FINDINGS

BEST COPY AVAILABLE

The three cities with the largest number of pupils enrolled in nonpublic schools were New York (355,958), Chicago (182,337), and Philadelphia (137,399).

On the average, nonpublic schools located in large cities tended to be larger than similar schools in the Nation as a whole. The average number of pupils enrolled in a nonpublic school in the 43 large cities studied was 439–147 more pupils than in the average nonpublic school throughout the Nation. The total number of large nonpublic schools in New York City, Chicago, and Philadelphia combined was twice that in the remaining 40 cities combined (tables 6, 7, and 8). Approximately two-thirds of the large-city schools with 1,000 or more pupils were located in the three cities. The average school size in New York City was 564 pupils; in Chicago, 475 pupils; and in Philadelphia, 684 pupils.

Pupil-teacher ratios also tended to be higher for large-city schools than for nonpublic schools nationwide. The elementary pupil-teacher ratio averaged 28.8 for the 43 cities, contrasting with the 26.9 national ratio. At the secondary level, the average large-city and national pupil-teacher ratios were 19.2 and 17.3, respectively.

Among the 43 cities, the highest elementary pupil-teacher ratio was reported by nonpublic schools in Philadelphia (37.0), and the highest secondary pupil-teacher ratio was reported in San Jose, CA (24.6). The highest pupil-teacher ratios among Roman Catholic schools were in Philadelphia, with an average of 42.4 pupils per elementary teacher and 30.5 pupils per secondary teacher. Among other-than-Catholic schools, the highest ratio of elementary pupils to teachers was in Kansas City, MO (26.7), while the highest ratio of secondary pupils to teachers was in Houston, TX (20.8). Pupil-teacher ratios were consistently higher in Roman Catholic schools than in other types of nonpublic schools for all the cities in this report.

Minority groups specified in the survey questionnaire were American Indian, Negro, Oriental, and Spanish-surnamed American. Although 10.0 percent of all 1970-71 nonpublic school enrollment nationwide was

represented by these minorities and the percentage of minority-group enrollment for all 43 cities combined was 15.7 percent, the proportion of minority-group enrollment varied widely among the 43 large cities (from 1.7 percent of the total nonpublic school pupils in St. Paul, MN, to 64.4 percent of those in El Paso, TX). (See table 18).

When each of the minority groups is considered separately, even more variation becomes evident. In numbers, New York City exceeded the minority enrollment of any other city with regard to American Indians (535), Orientals (2,485), and Spanish-surnamed Americans (42,911). Chicago's nonpublic schools had the largest number of Negroes (29,385). On the other hand, if the percentage of total nonpublic school enrollment is examined, the highest percentage of specified minority enrollment in nonpublic elementary and secondary schools was as follows: Spanish-surnamed Americans, 63 percent of the total in El Paso, TX; Negroes, 41 percent of the total in Washington, D.C.; Orientals, 8 percent of the total in San Francisco, CA; and American Indians, 2 percent of the total in Oklahoma City, OK. In 29 of the cities, Negroes constituted the largest proportion of minority-group enrollment. while in the remaining 14 cities most minority-group pupils were Spanish-surnamed Americans. Of the latter group of cities, nine were located in the States of California or Texas.

Table 18 further indicates that while schools in the inner-city areas of most large cities were serving a relatively small number of the city's nonpublic school pupils, over half the minority-group pupils in 21 of the cities were attending schools located in the inner-city areas. Sixteen of the cities reported that over 50 percent of the enrollment within the inner-city area was of minority-group pupils, while only two of the cities—El Paso and San Antonio—reported such a high proportion of minority-group pupils for the city as a whole.

Users are reminded that certain individual schools in many of the 43 cities did not respond to the 1970-71 survey and therefore are not represented in the tables.

BEST COPY AVAILABLE

(total number of responding schools).

Despite the underreporting, these data are considered of value because there is no alternative source of nonpublic elementary and secondary school statistics for cities. While these statistics may not be all-inclusive, they provide an indication, not otherwise available, of the role and characteristics of nonpublic education in many large cities.

(See table 20, which shows the number of responding and nonresponding schools by city.) In addition, as indicated in the headnotes of the tables, data presented on each characteristic described are based on response to the particular item. For tables 2, 3, 4, 5, and 18, the minority-item response rate is unknown. For other tables based on all schools, both elementary and secondary, the item response ranges from 3,275 to 3,615
